Description : Level of participation (value in decimal number, i.e. 0.1 for 10%).

Should only be provided when the position itself represents an equity participation in another entity (i.e., ownership of shares in a company). Accordingly, this field should be delivered only for nostro securities representing participations or for positions with a LegalAccountNumber between 111000 and 112000.

PledgeLink

Relevance	O	O	O	O	O	O	O	O	O

Description : Link between a group of exposures OR collaterals.

References :

→ [core_pledges__PayerPledgeLink](#)

→ [core_pledges__ReceiverPledgeLink](#)

Can be used to create subcategories for the same client for risk mitigation purposes.

If we consider the following case as an exemple :

Id	LegalAccountNumber	BookAmount	PledgeLink	CounterpartyId	CollateralHolderId	TypeOf
1	104001	400000	PledgeLink1	ClientA		LombardLoan
2	104001	300000	PledgeLink2	ClientA		LombardLoan
3	0	200000	PledgeLink1	ClientA	ClientA	Cash
4	0	200000	PledgeLink2	ClientA	ClientA	Cash

In this scenario, ClientA has two loans and two collaterals. The PledgeLink value creates subgroups for risk mitigation: The collateral with PledgeLink1 will cover only the loan associated with the same PledgeLink (loan with PledgeLink1). The same applies to PledgeLink2.

Important: In such cases, it remains mandatory to provide values for both CounterpartyId and CollateralHolderId. Supplying only a PledgeLink is not sufficient.

core_positions:

1	CH	102001	1000000	UK

Here, the counterpart operation for the UK entity would be the inverse of the Swiss entity's entry.

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB
Relevance	O	O	O	M	M	M	O	O

Description : The ISO 4217 3-letters currency code of the quote currency.

For FX derivatives, the quote currency used in the exchange rates (strike, forward and spot). Do not deliver for other types of derivatives.

Example:

- FX forward contract on 1'00'000 USD at 0.9CHF/USD (0.9CHF for one USD). QuoteCurrency = 'CHF'

NotionalUnderlyingCurrency

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB
Relevance	M	M	O	M	M	M	M	M

Description : Notional per contract, denominated in the underlying's currency.

Examples:

- 50 long futures contracts on bonds ABC, each of them on 25 bonds currently valued at 200 EUR, forward price of 210 EUR. If the notional is based on underlying's spot value: $\text{NotionalUnderlyingCurrency} = 200 * 25 = 5000$. If the notional is based on underlying's forward value: $\text{NotionalUnderlyingCurrency} = 200 * 25 = 5250$. For guidance on whether the spot of forward price should be used, see circ. 2015/1 A5-27.
 - Remark: 50 must be delivered in the field `core_positions.NumberOfComponents`
- FX forward contract on 1'00'000 USD at 0.9CHF/USD (0.9CHF for one USD). $\text{NotionalUnderlyingCurrency} = 1000000$

SpotUnderlyingCurrency

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB
Relevance	O	O	O	M	M	M	O	O

Description : Spot price of the underlying in the underlying's currency.

Examples:

- Futures contracts on bonds ABC, each of them on 25 bonds currently valued at 200 EUR, forward price of 210 EUR. $\text{SpotUnderlyingCurrency} = 200$.
- FX forward contract on 1'00'000 USD at 0.9CHF/USD (0.9CHF for one USD), spot rate = 0.85CHF/USD. $\text{SpotUnderlyingCurrency} = 0.85$

StrikeUnderlyingCurrency

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB
Relevance	O	O	O	M	M	M	O	O

Description : For options, the exercise price in the underlying's currency. For FX derivatives, the quotation should reflect the price of one unit of the base currency (underlying's currency) in term of the quote currency (quote currency/base currency). For swaption: swaption's fixed rate.

Examples:

- Swaption with an exercise rate (swap rate) of 8%. $\text{StrikeUnderlyingCurrency} = 0.08$.
- Call options on bonds ABC with strike price of 210 EUR. $\text{StrikeUnderlyingCurrency} = 210$.

ForwardPriceUnderlyingCurrency

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB
Relevance	O	O	O	M	M	M	M	M

Description : For forward contracts (futures), the forward (futures) price in the currency of the underlying. For FX derivatives, the quotation should reflect the price of one unit of the base currency (underlying's currency) in term of the quote currency (quote currency/base currency).

Example:

- 50 long futures contracts on bonds ABC, each of them on 25 bonds currently valued at 200 EUR, forward price of 210 EUR. $\text{ForwardPriceUnderlyingCurrency} = 210$.
- FX forward contract on 1'00'000 USD at 0.9CHF/USD (0.9CHF for one USD), spot rate = 0.85CHF/USD. $\text{SpotUnderlyingCurrency} = 0.9$

KnockInBarrierUnderlyingCurrency

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB
Relevance	O	O	O	O	O	O	O	O

Description : Knock-in barrier in the currency of the underlying. For FX derivatives, the quotation should reflect the price of one unit of the base currency (underlying's currency) in term of the quote currency (quote currency/base currency).

KnockOutBarrierUnderlyingCurrency

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB
Relevance	O	O	O	O	O	O	O	O

Description : Knock-out barrier in the currency of the underlying. For FX derivatives, the quotation should reflect the price of one unit of the base currency (underlying's currency) in term of the quote currency (quote currency/base currency).

Participation

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB
Relevance	O	O	O	M	M	M	O	O

Description : Participation in underlying performance. For accumulators and decumulators, corresponds to the gearing (deliver 2 for double gear). The default value is 1.

Multiplier

Module	ACC	BIS	CAS	CRE	MAR	LEX	LIQ	IRRBB	EKE
Relevance	M	M	O	M	M	M	M	M	M

Description : Number of underlyings per contract. For accumulators and decumulators on securities, the number of underlyings exchanged per fixing. The default value is 1.

Set to 1 for FX derivatives.

The most important is that the product `core_positions.NumberOfComponents * core_derivatives.Multiplier` equals the total number of underlyings. It is computed in the rule of the calculated field `core_derivatives_calc.NUmberOfUnderlyings`. Note that for FX derivatives `core_derivatives_calc.NUmberOfUnderlyings = cp.NumberOfComponents * cd.Multiplier * cd.NotionalUnderlyingCurrency`.

Examples:

- 50 long futures contracts on bonds ABC, each of them on 25 bonds currently valued at 200 EUR, forward price of 210 EUR. : `Multiplier = 25`.
 - Remark: 50 must be delivered in the field `core_positions.NumberOfComponents`
- FX forward contract on 1'00'000 USD at 0.9CHF/USD (0.9CHF for one USD). `Multiplier = 1`

NumberOfUnderlyings

published: false

Description : Total number of underlyings for the position. Computed as `core_positions.NumberOfContracts * core_derivatives.Multiplier`. Can also be an input. Computed in Rule

It is computed as `core_positions.NumberOfComponents * core_derivatives.Multiplier`, so the number of contracts multiplied by the number of underlying per contract. For FX derivatives, it is `core_positions.NumberOfComponents * core_derivatives.Multiplier * core_derivatives.NotionalUnderlyingCurrency` and since we expect the Multiplier to be usually 1 for this type of instrument, we expect the number of underlyings to be the total notional in reporting currency, i.e. the notional for one contract multiplied by the number of contracts.

ReplacementValue

Description : Replacement value of the derivative contract (signed). Computed in Rule

UnderlyingSpotValue

Description : Underlying spot market value in reporting currency. Computed in Rule

It is computed as the `core_derivatives_calc.SingleUnderlyingSpotValue` multiplied by `core_derivatives_calc.NumberOfUnderlyings`. See the documentation on the field `core_derivatives_calc.NumberOfUnderlyings` for more info on FX derivatives.

See the rule for more details on the calculation.

SingleUnderlyingSpotValue

Description : Spot value of a single underlying in reporting currency. Computed in Rule

This field is computed by converting the field `core_derivatives.SpotUnderlyingCurrency` into the reporting currency using the exchange rates in the table `ts_fx_rates`. It represents the spot value of one underlying in the reporting currency. For FX derivatives, it is the spot exchange rate where the quote currency is the reporting currency, and the base currency the one delivered in `core_derivatives.UnderlyingCurrency` (the value of one unit of underlying currency expressed in reporting currency).

See the rule for more details on the calculation.

UnderlyingStrikeForwardValue

Description : Underlying forward/strike value in reporting currency. Computed in Rule

It is computed as the `core_derivatives_calc.UnderlyingStrikeForwardValue` multiplied by `core_derivatives_calc.NumberOfUnderlyings`. See the documentation on the field `core_derivatives_calc.NumberOfUnderlyings` for more info on FX derivatives.

See the rule for more details on the calculation.

SingleUnderlyingStrikeForwardValue

Description : Forward/strike Value of a single underlying in reporting currency. Computed in Rule

This field is computed by converting the field `core_derivatives.StrikeUnderlyingCurrency` for options and `core_derivatives.ForwardPriceUnderlyingCurrency` for linear derivatives into the reporting currency using the exchange rates in the table `ts_fx_rates`. It represents the forward/strike value of one underlying in the reporting currency. For FX derivatives, it is the forward exchange rate converted using spot rates into the rate where the quote currency is the reporting currency, and the base currency the one delivered in `core_derivatives.UnderlyingCurrency` (the value of one unit of underlying currency expressed in reporting currency).

See the rule for more details on the calculation.

RCurrency

Description : Receivable currency. Computed in Rule

PCurrency

Description : Payable currency. Computed in Rule

RAmount

Description : Receivable amount. Computed in Rule

It represents the amount in reporting currency that would be received (not discounted), if the derivative was expiring today. It is in most cases either equal to `core_derivatives_calc.UnderlyingSpotValue` OR `core_derivatives_calc.UnderlyingStrikeForwardValue`, depending on the type of instrument and the direction of the contract (see `core_positions.LongContractFlag`.)

PAmount

Description : Payable amount. Computed in Rule

It represents the amount in reporting currency that would be paid (not discounted), if the derivative was expiring today. It is in most cases either equal to `core_derivatives_calc.UnderlyingSpotValue` OR `core_derivatives_calc.UnderlyingStrikeForwardValue`, depending on the type of instrument and the direction of the contract (see `core_positions.LongContractFlag`.)

Description : Present value of the receivable amount. Can also be an input. Computed in Rule
